SUPERSEDES: Procedure titled _____

Disease reporting enables public health follow-up for patients and helps identify outbreaks. This is particularly important to do in a timely way for any disease or condition that may require immediate public health intervention. Disease reporting also provides a better understanding of disease trends and patterns.

Each state or territory sets local laws and rules for which diseases and conditions must be reported. Always check the Home Address of the patient with the reportable disease.

Currently MMCCCL runs four (4) assays that require reporting for positive (reactive) results:

Hepatitis A:
-HAV IgM

Hepatitis B:
-HBsAg
-Anti-HBc IgM

Hepatitis C:
-Anti-HCV

Any 'Reactive' results for those tests should be reported to the state in which the patient resides.

For Georgia Patients:

***Reactive hepatitis results must be reported within 7 days ***

If the notifying party has login credentials for SendSS:

1. Log into https://sendss.state.ga.us/ords/sendss/login.mfa_post
2. Click the "Case Reporting" tab and enter the patient information.
3. Click 'Submit' when finished.

If the notifying party does not have SendSS login Credentials:

1. Call 1-866-782-4584 and report the result verbally.

For Patients outside of Georgia:

Currently, the lab does not run samples on patients who reside outside the state of Georgia.
